Corporate Social Responsibility: Driving Forces and Challenges

Anupam Sharma* and Ravi Kiran
Thapar University, Patiala, India

Abstract

Corporate social responsibility (CSR) is gaining more and more importance day by day. CSR is not only drawing the corporate magnates into its circumference, but is also luring educationists, social activists, reformists, from all over the world to delve deeper into it. Changing market scenario, globalization, ethical consumerism all are adding heat to the CSR concept. More and more organizations are showing their commitments towards CSR either for enhancing their corporate image or to be in competition. Emergence of different marketing innovations demands direct linkage of corporate social responsibility practices with the business corporate strategies. The present article reviews the CSR literature from 1975 to 2011, conveying changing developments of CSR practices.

Keywords: Globalization, ethical consumerism, competition, innovation.

Introduction

In today’s changing world, Corporate Social Responsibility (CSR) is a growing area of interest for academics, practitioners and entrepreneurs, in terms of both theory and practice.

Corporate Social Responsibility (CSR) is a concept whereby companies integrate social, environmental and health concerns in their business strategy (policy) and operations and in their interactions with stakeholders on a voluntary basis. The social responsibility of business encompasses the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time (Carroll, 1979).

As the world is shrinking due to globalization the concept of Corporate Social Responsibility (CSR) has acquired an undeniably high degree of relevance and scope in a large number of sectors. Many academicians and practitioners are developing theory and practices of this concept of social responsibility among entrepreneurs. Within this context, one frequently asked question is: What theory or model should be followed or considered for implementation of CSR practices?

In order to contribute to a clarification of the importance of the contributions made by the field of business towards society, the present paper tries to map the theoretical and practical perspective on CSR by studying country wide literature on CSR. This is done by considering various theories of CSR and CSR practices from the perspective of published research papers among the listed journals from year 1975 to 2011.

CSR is defined by The Prince of Wales International Business Leaders Forum as, “CSR means open and transparent business practices that are based on ethical values and respect for employees, communities, and the environment. It is designed to deliver sustainable value to society at large, as well as to shareholders” (http://www.iblf.org/csr) According to business for Social Responsibility (BSR), a U.S.-based global business organization: CSR means “operating a business enterprise in a manner that consistently meets or
exceeds the ethical, legal, commercial, and public expectations society has of business” (http://www.bsr.org/). In a more systematic way, Carroll (1999) has offered a historical sequence of the main developments in how the responsibilities of business in society have been understood.

Carroll (1991) presented his CSR model as a pyramid, as shown in Figure1. He once again uses his original historical explanation for the relative weighting, saying: “To be sure, all these kinds of responsibilities have always existed to some extent, but it has only been in recent years that ethical and philanthropic functions have taken a significant place” (p.40).

Earlier a few organizations focused on economic, responsibility, philanthropic, and legal responsibilities. But nowadays with the changing market situation this focus is shifting and including three other factors: environmental, educational and health responsibilities. Companies or organizations have started spending their social responsibility money for environmental benefits, public health care initiatives and for providing free education to the wads of employees and underprivileged.

In this paper, the researchers highlight the interaction between the three factors, education, health, and environment as represented in our model (Figure1). Based on education, health, and environment sectors the present study investigates the relationship or importance of these three factors (2E-H corporate social responsibility model), for undertaking CSR practices as these are at present the most preferred sectors in organizations. With globalization change is coming in traditional social responsibility practices, now entrepreneurs are spending maximum money of CSR expenditure on education, environment and health sectors (Sharma and Kiran, 2012a). Based on the literature it tries to find out the social responsibility practices adopted by the organizations.

</table>
The research paper has focused on reviewing and linking the literature in three domains: CSR practice, theory and country wise perspective. Finally the study focuses on developing a framework of CSR practices implementation. In this paper the literature covering most relevant theories and practices on CSR will be presented to see whether they are focusing on one of the above mentioned aspects- education, health and environment. At the same time, an attempt will be made to situate these theories and approaches within a general framework based on country wise contribution to the concept of CSR describing the current panorama regarding the role of business in society.

CSR Practice

Corporate Social Responsibility is an uncertain and complex term of assorted meaning (Matten and Moon, 2005). Social responsibility is used interchangeably with terms such as corporate responsibility and corporate sustainability (Waddock and Bodwell, 2007). Much of the literature on CSR to date has engaged in mitigating in economic/philanthropic terms the various activities connected with CSR (Basu and Palazzo, 2008; Margolis and Walsh, 2003). Before moving ahead, it is essential to study the country wise CSR perspective as shown in Table 1.

Although country specific studies focus on one aspect or other of CSR from the above analysis a transition in the concept of CSR is clearly visible. It can be stated that now CSR is a wider concept and has traversed from being focussed on social issues and collectivism to being involved with transparency, accountability and corporate citizenship. CSR is not only undertaken as a profit initiative or tax saving opportunity but continuously associated with consumer satisfaction in general and societal benefits in particular.

CSR Scenario: A Theoretical Discussion

The concept of CSR has evolved from two parallel developments. The first one comprises the efforts of policy makers and organizations to spread the idea of SRB and CSR practices at every level of the firm, by means of frequent initiatives, formal definitions and so on (Tencati et al., 2004; Zadek, 2002). More specifically, the European Union (EU) also has been contributing to the universal debate on CSR, providing an analysis of CSR: “a concept whereby companies/business firms decide voluntarily to contribute to the betterment of the social world and uplifting of society and a cleaner environment”(European Commission, 2001). This social responsibility affects employees and more generally all the stakeholders under one corporate umbrella. CSR means that organizations should integrate economic, social, health and environmental concerns into their business strategies, their management tools and other activities. However, in the beginning the focus was on large companies characterized by a progressively new range of activities. The public was becoming wary that corporate power was expanding much too rapidly. The CSR concept evolved despite usual uncertainty (Friedman, 1962). Throughout this period, most of the studies attempted to define unique features and rules of CSR (Manne and Wallich, 1972). Some of the theories (Ackerman, 1975; Preston and Post, 1975) centred on the relationship between companies and their social context: society interacts with business at large, lending it legitimacy and prestige.

CSR Framework

From the extensive literature review it has been determined that need of the hour is the development of CSR framework. So that companies can effectively channelize the available resources for social responsibility practices. Inputs for the development of CSR framework has been taken from the literature as study by Carroll (1991) helped us in determining the major contributors required for the development of CSR framework. According to Carroll’s CSR pyramid (1999), business should embrace economic, legal, ethical and philanthropic responsibilities. Study by Sharma and Kiran (2012b) showed the importance of case studies for the development of framework. Study by Maon et al. (2009) suggests need for integrative framework of Corporate Social Responsibility design and implementation. The literature provides a variety of views of researchers regarding CSR definitions and underlying dimensions (McWilliamset al. 2006). Till now, there is no universally accepted definition, measurement scale, and a universal
framework for the CSR concept, though some agreement exists on the potential positive impact (Branco and Rodrigues 2006; McWilliams et al. 2006; Smith 2003). What is needed is that firms must build their corporate values to create an organizational culture that is receptive to change and can sustain a corporate social responsibility strategy over the long run (Maon et al., 2009).

Studies by Lewis (2003), Lichtentein et al. (2004), and Nielsen et al. (2009) suggested that society values, new business opportunities, reduced regulatory interventions, customer satisfaction, firms’ reputation, and better stakeholder relationship are acting as different driving forces that are motivating business firms for the implementation of CSR initiatives. On the basis of above discussed literature survey, the CSR framework has been developed as shown in Figures 2 and 3.

**Discussion**

This paper examined the evolution of policy framework parameters and found that, rather than evidence of a single form of CSR practices, the organizations have to diversify, for example previously the shift was from philanthropic practices to Carroll’s social responsibility practices. Similarly with the changing world these social responsibility practices have to change according to the needs of the economy. The present study exhibits that both implicit and explicit CSR factors should be considered for a holistic approach as shown in the Figure1. Combination of four of Carroll’s responsibilities, including education, health, and environment will help in the formulation and implementation of social responsibility practices.

**Figure 2:** CSR model
Extensive literature review revealed that support from authorities will lead to formulation of CSR practices in the organizations. Figure 2 summarizes our findings on the relationships between explicit and implicit CSR, indicating the importance and requirement of different factors as co-existing within the framework. Table 1 helps in understanding the different counties focus upon social responsibility practices and the most preferred sectors. Business ethics and corporate responsibility have been more and more considered by both academics and practitioners in recent decades (Schwartz and Carroll, 2008; Vogel, 1991).

The present paper proposes a distinction between theoretical approaches for implementation of the CSR practices by proposing a framework for social responsibility practices. Flow chart of twenty first century’s perspective helps a lot in understanding the changing nature of CSR strategies. This is not to say that organizations’ social responsible practices can be explained only through the notion of above mentioned social responsibility factors but the combination of these perspectives must be considered, along with Carol’s model of social responsibility.

**Limitations**

The finding that education, environment and health sectors are more focused in comparison to other factors is not at all surprising if a pragmatic view is taken. Theoretically, a socially responsible organization is more attractive to potential staff and, therefore, it is less expensive to recruit in a talent competitive market (Phillips, 2008). It is also somewhat rewarded by customers and shareholders making it simpler to manage stakeholders and obtain further market share (Hammann *et al.*, 2009; Blumenfield, 2008). If organizations will
shift their focus from philanthropic and economic responsibilities to education, environment and health responsibility, this will help them in the development of healthy staff and a better social image in the eyes of customers and shareholders. This will also result in different organizational outcomes for businesses and social causes-companies definitely want the best of both the worlds.

Organizations interested in implementing social responsibility practices should, therefore, be cognizant of the diversity of skills of their leaders and may need to encourage different and new styles in order to be successful. Therefore, further research should examine whether the combination of these systems need to be mediated through some other variable such as another style of social responsibility. Combination of Carroll’s model with these three perspectives may lead to better implementation of social responsibility practices. It may be better to go for transformational leadership, which although not authentic, is an effective means of dealing with the conflict between the two types of CSR practices. Shift in the nature of CSR strategies or practices is clear from the above explained flow chart 1. Transformational leadership approach may be the key to stirring debate and innovation, thereby, providing the innovation needed to produce ‘solutions’ for enhanced sustainable corporate practices.

Finally, it is important to recognize the limitations of this research. The most substantial limitation is that it is based on the literature review of published renowned journals. It may be that these findings are not transferable or applicable to some organizations in total or that they are dependent on the type of organization, a bank in this case, because the results of the present research are not according to any particular organization. These are review based findings. Therefore, additional research is needed to determine whether these findings are situational rather than generalizable. These findings could be tested by additional research method such as the use of quantitative questionnaires alongside qualitative data.

Suggestions for Further Research

The current research does indicate an interesting path for the future research. Firstly, we could complement the results found here with a more quantitative approach. These could be achieved through the use of questionnaires and a regression-based analysis of the factors that align with economic, ethical, philanthropic, and legal responsibilities along with educational, environmental and health perspectives. Secondly, further research could examine the effects of this framework on some external measure of CSR success. Carroll’s model of social responsibility practices is renowned; therefore, researchers suggest examining the effects of educational, environmental and health responsibility on the organizations social responsibility practices, budget and their social image. Finally, this will encourage researchers to examine whether the effect found here is an organizational lifecycle phenomenon that may disappear as organizations include corporate social responsibility practices in their culture.
